Use Case – Create Account

A new customer just bought our application. They have no profile. The system will guide the customer step by step to help them get their log in credentials. After this they can use the edit profile functionality to grow their profile.

Actor: Customer

Preconditions: Application must be running

Postconditions: Profile will be created

Main Flow

1. Customer requests to create an account
2. System prompts for a username, email address and password
3. Customer enters credentials
4. System verifies email address and that username is not in use
5. System creates the account and saves it
6. Customer can now log in

Alternative Flow

4b.   Invalid email address
1. System displays invalid email error

4c.   Username already in use
1. System displays username in use error
